

MATAS TIJUSAS

DevOps & Cybersecurity Student

matas.tijusas@outlook.com · +370 623 26156 · [linkedin.com/in/matas-tijusas](https://www.linkedin.com/in/matas-tijusas) · gitlab.com/MatasTij · https://mateuzas.github.io/personal_website

PROFILE

IT student building toward a DevSecOps career, with hands-on experience across the full DevOps lifecycle on AWS, from containerised applications through GitOps-style multi-environment deployment and observability. Recently completed Deutsche Telekom's intensive DevOps programme, delivering a production-grade Kubernetes platform secured with encrypted secrets and policy-as-code. Currently extending the GUARD static-analysis tool to detect security smells across multiple Infrastructure-as-Code languages for my bachelor's thesis.

SKILLS

Containers & Orchestration: Docker, Docker Compose, Kubernetes, Helm, Helmfile, Kaniko, nginx

CI/CD: GitLab CI/CD, multi-stage Dockerfiles, cross-project pipeline configuration, smoke-test gating

Cloud & IaC: AWS (EKS, EC2, IAM), Terraform, Ansible

Security & Secrets: SOPS + age, Ansible Vault, Kyverno policies, OWASP Top 10, Burp Suite, Wireshark, Metasploit

Observability: Prometheus, kube-prometheus-stack, OpenLens

Programming: Python, Go (familiar), JavaScript / React, SQL, Bash, Linux, PostgreSQL, Git

Languages: Lithuanian (native), English (C1), Russian (B2), Spanish (B1), Dutch (A2)

EXPERIENCE

Bachelor Thesis — Static Analysis of Infrastructure as Code · University of Twente
2026

- Extending the GUARD static-analysis tool to detect security smells and code-quality issues across multiple IaC languages (Ansible, Terraform, Puppet).

Odoo Module Developer · Aardug & Novito 2025 – Present

- Building a custom Odoo module for Novito (construction firm) to automate base-price calculation for construction projects.
- Collaborating with Aardug, an Odoo specialist partner, on architecture design and module integration.
- Stack: Python, Odoo ORM, XML views; cross-functional Agile team.

DevOps Course · Deutsche Telekom — 3-month intensive industry programme 2025

- Containerised a full-stack Go/React application with multi-stage Dockerfiles; built and pushed images via Kaniko on GitLab CI (chosen over Docker-in-Docker for reduced privilege requirements and reproducibility).
- Deployed across dev and prod Amazon EKS environments using three custom Helm charts (frontend, backend, database) published to the GitLab Package Registry; orchestrated declaratively with Helmfile to replace imperative deploy scripts.
- Designed a multi-stage GitLab CI/CD pipeline (build → test → dockerization → deploy → smoke-test) with shared configuration extracted to a separate repo and pulled in via include; pinned tool versions for reproducibility.
- Provisioned a self-hosted GitLab runner on AWS EC2 using Terraform and Ansible; scoped via runner tags to smoke-test jobs that verify deployed environments through ingress URLs.
- Implemented end-to-end secrets management: SOPS with age encryption for Kubernetes secrets stored in git, Ansible Vault for runtime configuration, GitLab masked/protected CI variables for cloud credentials, zero plaintext secrets in any repository.
- Integrated with the shared cluster's kube-prometheus-stack via namespace-scoped PrometheusRule resources, working within tenant ResourceQuota limits and Kyverno admission policies (registry allowlists, run-as-non-root enforcement).

EDUCATION

BSc, IT & Business · University of Twente

Expected 2026

ADDITIONAL

Former Professional Footballer — discipline, teamwork, and resilience under pressure.

International Experience — lived and studied abroad; comfortable in multicultural environments.
